RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 108 pages. Dimensions: 9.7in. x 7.4in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1896 edition. Excerpt: . . . too many negative values. Before taking means of the intervals and heights, the length of series to be used must be decided upon. Length of series suitable for finding the semidiurnal range of tide and the mean lunital interval. --Since the variation in range, from day to day depends chiefly upon the manner in which the semidiurnal components fall upon  $M_2$ , the required length of series should be, as nearly as possible, a multiple of the synodic periods of  $S_2$ ,  $N_2$ ,  $L_2$ ,  $K_2$ , . . . with  $M_2$ ; i. e. of the form  $a Sa$  14-765 b ( $N_2 L_2$ ) 27-555 c  $K_2$  13-661 . . . where a, b, c, . . . are integers. The weights  $S_2$ ,  $N_2$  4- $L_2$ ,  $K_2$ , . . . are given to the synodic periods because the direct effect of any component in altering the range of the tide is nearly proportional to its amplitude. For the purpose of eliminating the diurnal inequality as far as possible, the, l water which ends the series should be of the opposite kind from the, u water beginning it. As a length of series suited to the high waters is generally also suited to the low waters, one should solve the above equation to the nearest lunar half day. This having been done, the results expressed in mean solar days are as follows: For a more elaborate mode of analysis, see a paper by Prof. G. H. Darwin entitled On the harmonic...
