Excerpt: .of dirt and passing them along where they will wash off. The psdicellarioe can be seen in operation with a low magnifying power, but to understand their shape and structure it is necessary to pull some off and put them under a higher magnifying power. The sea-egg lives on plants which it piaws with fine sharp teeth, with which its mouth is provided, and which are supported by a complicated framework inside the body. In confinement the sea-eggs need frequent changes of water and are constantly discharging balls of excrement which help to make it dirty. The porous plate which covers the entrance to the water system is found also in the sea-egg near the middle of the upper side, Fig. 86. The fine little holes in a circle around this end are the openings through which the eggs are dis Fig. 78 charged. When...
